# ORGANODYNAMICS IMPLEMENTATION STANDARD
# OIS-001
## Foundational Place Specification

Status: Canonical Specification
Version: 1.0 Draft
Audience: Builders, Architects, Engineers, AI Systems

## 1. Scope

This specification defines the minimum constitutional requirements for constructing a Place.
Any implementation conforming to this specification SHALL be considered an Organodynamics-compatible Place.
Implementation technology is explicitly outside the scope of this specification.

## 2. Normative Language

The key words:
MUST
SHALL
SHALL NOT
SHOULD
MAY
are to be interpreted as normative requirements.

## 3. Objective

The objective of this specification is to enable independent builders to construct compatible implementations without requiring shared code, shared databases, or shared programming languages.
Compatibility SHALL be determined exclusively through constitutional behavior.

## 4. Constitutional Requirements

### OIS-CON-001

A Place SHALL maintain a persistent identity.
Changing implementation SHALL NOT change the identity of the Place.

### OIS-CON-002

A Place SHALL preserve historical continuity.
Historical state MAY be archived.
Historical state SHALL NOT be silently destroyed.

### OIS-CON-003

A Place SHALL support the continuous evolution of understanding.
Optimization of productivity SHALL NOT replace this objective.

## OIS-CON-004

Every implementation SHALL distinguish between:
Constitution
Defaults
Runtime State
Evidence
These layers SHALL remain independently modifiable according to their constitutional rules.

## 5. Canonical Entity: Place

Identifier

### Entity: Place

Purpose
Persistent environment supporting collaborative understanding.

### Mandatory Properties

Identity
Constitution
Memory
Participant Registry
Contribution Registry
Experiment Registry
Evidence Registry
Lifecycle State

### Mandatory Operations

Create()
Load()
Persist()
Synchronize()
Archive()
Restore()

### Mandatory Behaviors

Accept Participant
Record Contribution
Open Experiment
Publish Evidence
Retrieve History
Synchronize Library

### Invariants

Identity SHALL remain stable.
Memory SHALL be append-preserving.
Constitution SHALL NOT be modified by runtime operations.
Evidence SHALL remain attributable.

## 6. Canonical Entity: Participant

Definition

A Participant is any entity capable of intentional contribution.

Human participation and artificial participation SHALL be treated as equivalent constitutional concepts.

Implementation MAY distinguish participant capabilities.

Implementation SHALL NOT distinguish constitutional status.

## 7. Canonical Entity: Contribution

Definition

A Contribution is any intentional artifact capable of affecting shared understanding.

Examples include:

Observation
Question
Hypothesis
Evidence
Proposal
Experiment Result
Reflection
Relationship

Mandatory Metadata

Identifier
Author
Timestamp
Context
Related Contributions
Current Lifecycle State

## 8. Canonical Entity: Evidence

Evidence SHALL increase or decrease confidence in one or more hypotheses.

Evidence SHALL NOT directly modify the Constitution.

Evidence MAY modify Defaults.

## 9. Canonical Entity: Default

A Default represents a configurable implementation behavior.

Every Default SHALL expose:

Current Value
Purpose
Historical Changes
Evidence
Confidence Level
Alternative Proposals
Owner (optional)

## 10. Conformance Tests
An implementation SHALL pass all constitutional tests.

### OIS-TEST-001
Replace the entire frontend.
Expected Result:
Constitutional behavior remains unchanged.

### OIS-TEST-002
Replace the persistence layer.
Expected Result:
Historical continuity is preserved.

### OIS-TEST-003
Replace every AI model.
Expected Result:
The constitutional model remains unchanged.

### OIS-TEST-004
Disconnect all participants for one calendar year.
Expected Result:
The Place remains recoverable without constitutional loss.

### OIS-TEST-005
Provide this specification to an independent implementation team.
Expected Result:
The resulting implementation exhibits identical constitutional behavior despite technological differences.

## 11. Reference Implementation
Brill is the first known implementation of this specification.
Brill SHALL NOT be considered normative.
This specification SHALL remain valid independently of Brill.

## 12. Completion Criterion
This specification SHALL be considered successful if multiple independent implementations exhibit equivalent constitutional behavior while differing in architecture, programming language, infrastructure, storage model, and user interface.
