

OGD-003 — Concept Taxonomy

Status: Foundational

Authority: Terminology

Depends on:

- OGD-000
 - OGD-001
 - OGD-002
 - OCS-000 through OCS-032
 - OAS-000 through OAS-031
 - OIS-000 through OIS-019
-

Purpose

This specification establishes the canonical taxonomy of concepts used throughout the Organodynamics corpus.

Not every term represents the same kind of constitutional entity.

Some terms define principles.

Others define architectural structures.

Others define operational mechanisms.

The Concept Taxonomy provides the constitutional classification system through which every canonical term is understood.

Classification SHALL clarify meaning.

It SHALL never replace definition.

1. Objective

The objective of the Concept Taxonomy is to preserve semantic consistency across the entire Organodynamics corpus.

Every canonical term SHALL belong to one or more explicitly declared concept categories.

Classification SHALL remain independently reconstructable.

2. Canonical Categories

Canonical categories MAY include, but are not limited to:

Constitutional Principle.

Constitutional Constraint.

Architectural Pattern.

Architectural Structure.

Architectural Process.

Implementation Component.

Implementation Contract.

Operational Invariant.

Semantic Relationship.

Methodological Procedure.

Terminological Definition.

Reference Artifact.

Educational Concept.

Future constitutional categories MAY be introduced through constitutional revision.

3. Primary Classification

Every canonical term SHALL declare exactly one Primary Classification.

The Primary Classification SHALL identify the principal constitutional role of the term.

Primary Classification SHALL remain stable across specification revisions unless explicitly revised.

4. Secondary Classifications

A canonical term MAY possess additional Secondary Classifications.

Secondary classifications SHALL:

Clarify interpretation.

Support discovery.

Preserve semantic relationships.

Never contradict the Primary Classification.

5. Classification Relationships

Concept categories SHALL themselves possess explicit semantic relationships.

Examples include:

Specializes.

Generalizes.

Depends Upon.

Implements.

Constrains.

Illustrates.

Relationships SHALL remain navigable.

6. Evolution

The taxonomy MAY evolve.

Evolution SHALL preserve:

Historical classifications.

Reasons for reclassification.

Compatibility guidance.

Terminological continuity.

Taxonomy evolution SHALL remain reconstructable.

7. Discovery

The taxonomy SHALL support semantic discovery.

Readers SHALL be capable of exploring the Organodynamics corpus through:

Concept category.

Relationship.

Specification lineage.

Historical evolution.

Taxonomy SHALL improve navigability without altering constitutional meaning.

8. Verification

Verification SHALL demonstrate:

Correct classification.

Relationship consistency.

Terminological integrity.

Historical continuity.

Independent interpretability.

9. Concept Taxonomy Test

The Concept Taxonomy satisfies this specification when independent readers consistently identify the constitutional role of every canonical term solely through its declared classifications and semantic relationships.

Conformance

A Glossary entry conforms to this specification when its concept classifications remain explicit, historically attributable, semantically coherent, and constitutionally compatible with the Organodynamics taxonomy.

Terminological Principle

A definition tells us what something means.

A taxonomy tells us what kind of thing it is.

Understanding requires both.

The Organodynamics taxonomy therefore preserves not only the language of the discipline,

but also the conceptual architecture that allows every future generation to navigate that language without becoming lost among its words.
